Fluency Support for Grades 6–8

INTRODUCTION

The Common Core Standards for Mathematics call for students to obtain and demonstrate not only conceptual understanding and problem solving, but also procedural skill and fluency. Documents released by Student Achievement Partners go on to describe procedural skill and fluency as speed and accuracy in calculation that enable students to apply mental resources to more complex concepts and processes.

Standards in grades K–6 use the word *fluent*, or *fluently*, to explicitly call for students to achieve quickness and accuracy in calculations. In later grades the standards themselves do not use the word *fluent* or *fluently*. By middle school, fluency is less about calculation, and more about ease of manipulation of expressions, equations, notations, etc. Thus fluency exercises are applied toward any skill needed to manipulate expressions and equations with ease. For example, in Grade 8 students should work towards quickly and accurately solving general, one-variable linear equations.

An additional resource for guiding fluency work in later grades is the *PARCC Model Content Frameworks for Mathematics*. This document provides a section entitled, *Key Fluencies and Examples of Culminating Standards*. The table below lists the standards identified therein for Grades 6–8, along with the accompanying narrative from the document.

PARCC Model Content Frameworks for Mathematics¹ –

Fluency Expectations or Examples of Culminating Standards for Grades 6–8

6.NS.2	Students fluently divide multi-digit numbers using the standard algorithm. This is the culminating standard for several years' worth of work with division of whole numbers.
6.NS.3	Students fluently add, subtract, multiply, and divide multi-digit decimals using the standard algorithm for each operation. This is the culminating standard for several years' worth of work relating to the domains of Number and Operations in Base Ten, Operations and Algebraic Thinking, and Number and Operations—Fractions.
6.NS.1	Students interpret and compute quotients of fractions and solve word problems involving division of fractions by fractions. This completes the extension of operations to fractions.
7.EE.3	Students solve multistep problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. This work is the culmination of many progressions of learning in arithmetic, problem solving and mathematical practices.
7.EE.4	In solving word problems leading to one-variable equations of the form $px + q = r$ and $p(x + q) = r$, students solve the equations fluently. This will require fluency with rational number arithmetic (7.NS.1–3), as well as fluency to some extent with applying properties operations to rewrite linear expressions with rational coefficients (7.EE.1).

¹ The PARCC Model Content Frameworks for Mathematics can be found at <http://parccconline.org/mcf/mathematics/overview-parcc-model-content-frameworks-mathematics>

7.NS.1-2 Adding, subtracting, multiplying, and dividing rational numbers is the culmination of numerical work with the four basic operations. The number system will continue to develop in grade 8, expanding to become the real numbers by the introduction of irrational numbers, and will develop further in high school, expanding to become the complex numbers with the introduction of imaginary numbers. Because there are no specific standards for rational number arithmetic in later grades and because so much other work in Grade 7 depends on rational number arithmetic (see below), fluency with rational number arithmetic should be the goal in Grade 7.
8.EE.7 Students have been working informally with one-variable linear equations since as early as kindergarten. This important line of development culminates in Grade 8 with the solution of general one-variable linear equations, including cases with infinitely many solutions or no solutions as well as cases requiring algebraic manipulation using properties of operations. Coefficients and constants in these equations may be any rational numbers.
8.G.9 When students learn to solve problems involving volumes of cones, cylinders, and spheres—together with their previous Grade 7 work in angle measure, area, surface area and volume (7.G.4–6)—they will have acquired a well-developed set of geometric measurement skills. These skills, along with proportional reasoning (7.RP) and multistep numerical problem solving (7.EE.3), can be combined and used in flexible ways as part of modeling during high school—not to mention after high school for college and careers. ¹⁹

Development of fluency for any skill, computational or otherwise, is achieved optimally through exercises that create excitement through use of time constraints or time-related goals. Note, however, that fluency exercises are not a means for learning the skill for the first time, rather fluency exercises are to be conducted after the delivery of one or several lessons which develop conceptual understanding and which provide opportunities to practice newly learned skills in a non-time-constrained setting. Students must first understand why the procedures or processes they are using work and must achieve a general capacity in that skill before they are ready to work on quick accuracy.

A second critical element in an effective fluency exercise is providing students with immediate feedback to the correctness of their work and to their progress in developing speed.

This document provides fluency exercises of two types, the Rapid White Board Exchange (RWBE) and the Sprint. The RWBE allows time for students to share their work with a partner, to remediate small learning gaps, and for the teacher to assess each student's readiness for further fluency work on that skill. The RWBE supports a class of students in moving towards readiness for fluency, while allowing those students who are ready, to begin the work of fluency. Thus, the RWBE should be used before a Sprint on a given skill. Additionally, the RWBE is a practical tool for students to utilize when practicing skills that require more written support or work space.

While Sprints are not useful for skills that require significant work space, they are immensely effective at improving fluency for skills requiring little written support. For example, a Sprint is not practical for practicing the long division algorithm, but is practical for multiplication of integers which can be computed mentally. Sprints on a given skill should always be administered as a back-to-back pair of coordinated Sprints on the same skill. There is a designated period of time between the two Sprints where students can work at a slower pace, asking questions and getting assistance if needed.

This document provides RWBE's and Sprints to support each of the fluencies identified in the Standards and the PARCC Model Content Framework. It is *not* recommended that fluency work be restricted to the module(s) in which a given skill is introduced. Rather, teachers are encouraged to work on fluencies throughout the year, once conceptual understanding has been established. Reusing the same fluency

exercise as often as once every two weeks is a reasonable and appropriate means of developing and improving fluency on a given skill.

Rapid White Board Exchanges

Implementing an RWBE requires that each student be provided with a personal white board, a white board marker, and an eraser. An economic choice for these materials is to place two sheets of tag board (recommended) or cardstock, one red and one white, into a sheet protector. The white side is the “paper” side that students write on. The red side is the “signal” side, which can be used for students to indicate they have finished working—“Show red when ready.” Sheets of felt cut into small squares can be used as erasers.

An RWBE consists of a sequence of 10 to 20 problems on a specific topic or skill that starts out with a relatively simple problem and progressively gets more difficult. The teacher should prepare the problems in a way that allows the teacher to reveal them to the class one at a time. A flip chart or PowerPoint presentation can be used, or the teacher can write the problems on the board and either cover some with paper or simply write only one problem on the board at a time.

The teacher reveals, and possibly reads aloud, the first problem in the list and announces, “Go.” Students work the problem on their personal white boards as quickly as possible. Depending on teacher preference, students can be directed to hold their work up for their teacher to see their answers as soon as they have the answer ready or to turn their white boards face down to show the red side when they have finished. In the latter case, the teacher says, “Hold up your work,” once all students have finished. The teacher gives immediate feedback to each student, pointing and/or making eye contact with the student and responding with an affirmation for correct work, such as “Good job!”, “Yes!”, or “Correct!”, or responding with guidance for incorrect work such as “Look again,” “Try again,” “Check your work,” etc. Feedback can also be more specific, such as “Watch your division facts,” or “Error in your calculation.”

If many students have struggled to get the answer correct, go through the solution of that problem as a class before moving on to the next problem in the sequence. Fluency in the skill has been established when the class is able to go through a sequence of problems leading up to and including the level of the relevant student objective, without pausing to go through the solution of each problem individually.

Sprints

Sprints are designed to develop fluency. They should be fun, adrenaline-rich activities that intentionally build energy and excitement. A fast pace is essential. During Sprint administration, teachers assume the role of athletic coaches. A rousing routine fuels students’ motivation to do their personal best. Student recognition of increasing success is critical, and so every improvement is acknowledged. (See the Sprint Delivery Script for the suggested means of acknowledging and celebrating student success.)

One Sprint has two parts with closely related problems on each. Students complete the two parts of the Sprint in quick succession with the goal of improving on the second part, even if only by one more. The problems on the second Sprint should not be harder, or easier, than the problems on the first Sprint. The problems on a Sprint should progress from easiest to hardest. The first quarter of problems on the Sprint should be simple enough that all students find them accessible (though not all students will finish the first quarter of problems within one minute). The last quarter of problems should be challenging enough that even the strongest students in the class find them challenging.

Sprints scores are not recorded. Thus, there is no need for students to write their names on the Sprints. The low-stakes nature of the exercise means that even students with allowances for extended time can participate. When a particular student finds the experience undesirable, it is reasonable to either give the student a copy of the sprint to practice with the night before, or to allow the student to opt out and take the Sprint home.

With practice, the Sprint routine takes about 8 minutes.

Sprint Delivery Script

Gather the following: stopwatch, a copy of Sprint A for each student, a copy of Sprint B for each student, answers for Sprint A and Sprint B. The following delineates a script for delivery of a pair of Sprints.

This sprint covers: *topic*.

Do not look at the Sprint; keep it turned face down on your desk.

There are *xx* problems on the Sprint. You will have 60 seconds. Do as many as you can. I do not expect any of you to finish.

On your mark, get set, GO.

60 seconds of silence.

STOP. Circle the last problem you completed.

I will read the answers. You say “YES” if your answer matches. Mark the ones you have wrong by circling the number of the problem. Don’t try to correct them.

Energetically, rapid-fire call the answers ONLY.

Stop reading answers after there are no more students answering, “Yes.”

Fantastic! Count the number you have correct, and write it on the top of the page. This is your personal goal for Sprint B.

Raise your hand if you have 1 or more correct. 2 or more, 3 or more...

Let us all applaud our runner-up, [insert name], with *x* correct. And let us applaud our winner, [insert name], with *x* correct.

You have a few minutes to finish up the page and get ready for the next Sprint.

Students are allowed to talk and ask for help; let this part last as long as most are working seriously.

Stop working. I will read the answers again so you can check your work. You say “YES” if your answer matches.

Energetically, rapid-fire call the answers ONLY.

Optionally, ask students to stand, and lead them in an energy-expanding exercise that also keeps the brain going. Examples are jumping jacks or arm circles, etc., while counting by 15’s starting at 15, going up to 150 and back down to 0. You can follow this first exercise with a cool down exercise of a similar nature, such as calf raises with counting by one-sixths $(\frac{1}{6}, \frac{1}{3}, \frac{1}{2}, \frac{2}{3}, \frac{5}{6}, 1 \dots)$.

Hand out the second Sprint, and continue reading the script.

Keep the Sprint face down on your desk.

There are xx problems on the Sprint. You will have 60 seconds. Do as many as you can. Your goal is to improve your score from the first Sprint.

On your mark, get set, GO.

60 seconds of silence.

STOP. Circle the last problem you completed.

I will read the answers. You say “YES” if your answer matches. Mark the ones you have wrong by circling the number of the problem. Don’t try to correct them.

Quickly read the answers ONLY.

Count the number you have correct, and write it on the top of the page. Write the amount by which your score improved at the top of the page and circle it.

Raise your hand if you have 1 or more correct. 2 or more, 3 or more, ...

Let us all applaud our runner-up, [insert name], with x correct. And let us applaud our winner, [insert name], with x correct.

Raise your hand if you improved your score by 1 or more. 2 or more, 3 or more, ...

Let us all applaud our runner-up for most improved, [insert name]. And let us applaud our winner for most improved, [insert name].

You can take the Sprint home and finish it if you want.

Grade 6 Mapping of Fluency Exercises to Fluency Requirements

The following table lists all fluency exercises provided for use in Grade 6; footnotes by the related standard indicate whether fluency is specifically called for by the standard itself and/or by the PARCC Model Content Frameworks for Mathematics. Depending on the level of skill of the students, it may be appropriate to supplement these exercises with additional fluency exercises from Grades 3–5 of *A Story of Units*.

The table also indicates the earliest recommended use—in all cases, fluency exercises should not be conducted until after conceptual understanding has been taught and achieved through the lessons in *A Story of Ratios*. Below the table, the text of each related standard is provided for reference.

Apply and extend previous understandings of multiplication and division to multiply and divide fractions.

- 5.NF.B.4** Apply and extend previous understandings of multiplication to multiply a fraction or whole number by a fraction.
- Interpret the product $(a/b) \times q$ as a parts of a partition of q into b equal parts; equivalently, as the result of a sequence of operations $a \times q \div b$. For example, use a visual fraction model to show $(2/3) \times 4 = 8/3$, and create a story context for this equation. Do the same with $(2/3) \times (4/5) = 8/15$. (In general, $(a/b) \times (c/d) = ac/bd$.)
 - Find the area of a rectangle with fractional side lengths by tiling it with unit squares of the appropriate unit fraction side lengths, and show that the area is the same as would be found by multiplying the side lengths. Multiply fractional side lengths to find areas of rectangles, and represent fraction products as rectangular areas.

Apply and extend previous understandings of multiplication and division to divide fractions by fractions.

- 6.NS.A.1** Interpret and compute quotients of fractions, and solve word problems involving division of fractions by fractions, e.g., by using visual fraction models and equations to represent the problem. For example, create a story context for $(2/3) \div (3/4)$ and use a visual fraction model to show the quotient; use the relationship between multiplication and division to explain that $(2/3) \div (3/4) = 8/9$ because $3/4$ of $8/9$ is $2/3$. (In general, $(a/b) \div (c/d) = ad/bc$.) How much chocolate will each person get if 3 people share $1/2$ lb. of chocolate equally? How many $3/4$ -cup servings are in $2/3$ of a cup of yogurt? How wide is a rectangular strip of land with length $3/4$ mi and area $1/2$ square mi?

Compute fluently with multi-digit numbers and find common factors and multiples.

- 6.NS.B.2** Fluently divide multi-digit numbers using the standard algorithm.
- 6.NS.B.3** Fluently add, subtract, multiply, and divide multi-digit decimals using the standard algorithm for each operation.
- 6.NS.B.4** Find the greatest common factor of two whole numbers less than or equal to 100 and the least common multiple of two whole numbers less than or equal to 12. Use the distributive property to express a sum of two whole numbers 1–100 with a common factor as a multiple of a sum of two whole numbers with no common factor. For example, express $36 + 8$ as $4(9 + 2)$.

Apply and extend previous understandings of numbers to the system of rational numbers.

- 6.NS.C.7a** Understand ordering and absolute value of rational numbers.
- Interpret statements of inequality as statements about the relative position of two numbers on a number line diagram. *For example, interpret $-3 > -7$ as a statement that -3 is located to the right of -7 on a number line oriented from left to right.*

Reason about and solve one-variable equations and inequalities.

- 6.EE.B.7** Solve real-world and mathematical problems by writing and solving equations of the form $x + p = q$ and $px = q$ for cases in which p , q and x are all nonnegative rational numbers.

Solve real-world and mathematical problems involving area, surface area, and volume.

- 6.G.A.1** Find the area of right triangles, other triangles, special quadrilaterals, and polygons by composing into rectangles or decomposing into triangles and other shapes; apply these techniques in the context of solving real-world and mathematical problems.

Grade 7 Mapping of Fluency Exercises to Fluency Requirements

The following table lists all fluency exercises provided for use in Grade 7; footnotes by the related standard indicate whether fluency is specifically called for by the PARCC Model Content Frameworks for Mathematics. (Note that there are no standards in Grade 7 that call for fluency explicitly by use of the word *fluent* or *fluently*.) Depending on the level of skill of the students, it may be appropriate to supplement these exercises with additional fluency exercises from Grade 6 and/or from Grades 3–5 of *A Story of Units*.

Analyze proportional relationships and use them to solve real-world and mathematical problems.

- 7.RP.A.3** Use proportional relationships to solve multistep ratio and percent problems. *Examples: simple interest, tax, markups and markdowns, gratuities and commissions, fees, percent increase and decrease, percent error.*

Apply and extend previous understandings of operations with fractions to add, subtract, multiply, and divide rational numbers.

- 7.NS.A.2c** Apply and extend previous understandings of multiplication and division of fractions to multiply and divide rational numbers.
- c. Apply properties of operations as strategies to multiply and divide rational numbers.

Use properties of operations to generate equivalent expressions.

- 7.EE.A.2** Understand that rewriting an expression in different forms in a problem context can shed light on the problem and how the quantities in it are related. *For example, $a + 0.05a = 1.05a$ means that “increase by 5%” is the same as “multiply by 1.05.”*

Solve real-life and mathematical problems using numerical and algebraic expressions and equations.

- 7.EE.B.3** Solve multi-step real-life and mathematical problems posed with positive and negative rational numbers in any form (whole numbers, fractions, and decimals), using tools strategically. Apply properties of operations to calculate with numbers in any form; convert between forms as appropriate; and assess the reasonableness of answers using mental computation and estimation strategies. *For example: If a woman making \$25 an hour gets a 10% raise, she will make an additional 1/10 of her salary an hour, or \$2.50, for a new salary of \$27.50. If you want to place a towel bar 9 3/4 inches long in the center of a door that is 27 1/2 inches wide, you will need to place the bar about 9 inches from each edge; this estimate can be used as a check on the exact computation.*

- 7.EE.B.4b** Use variables to represent quantities in a real-world or mathematical problem, and construct simple equations and inequalities to solve problems by reasoning about the quantities.
- b. Solve word problems leading to inequalities of the form $px + q > r$ or $px + q < r$, where p , q , and r are specific rational numbers. Graph the solution set of the inequality and interpret it in the context of the problem. *For example: As a salesperson, you are paid \$50 per week plus \$3 per sale. This week you want your pay to be at least \$100. Write an inequality for the number of sales you need to make, and describe the solutions.*

Grade 8 Mapping of Fluency Requirements to Fluency Exercises

The following table lists all fluency exercises provided for use in Grade 8; footnotes by the related standard indicate whether fluency is specifically called for by the PARCC Model Content Frameworks for Mathematics. (Note that there are no standards in Grade 8 that call for fluency explicitly by use of the word *fluent* or *fluently*.) Depending on the level of skill of the students, it may be appropriate to supplement these exercises with additional fluency exercises from Grades 6 and 7.

The table also indicates the earliest recommended use—in all cases, fluency exercises should not be conducted until after conceptual understanding has been taught and achieved through the lessons in *A Story of Ratios*. Below the table, the text of each related standard is provided for reference.

Work with radicals and integer exponents.

- 8.EE.A.1** Know and apply the properties of integer exponents to generate equivalent numerical expressions. *For example, $3^2 \times 3^{-5} = 3^{-3} = 1/3^3 = 1/27$.*
- 8.EE.A.4** Perform operations with numbers expressed in scientific notation, including problems where both decimal and scientific notation are used. Use scientific notation and choose units of appropriate size for measurements of very large or very small quantities (e.g., use millimeters per year for seafloor spreading). Interpret scientific notation that has been generated by technology.

Analyze and solve linear equations and pairs of simultaneous linear equations.

- 8.EE.C.7** Solve linear equations in one variable.
- Give examples of linear equations in one variable with one solution, infinitely many solutions, or no solutions. Show which of these possibilities is the case by successively transforming the given equation into simpler forms, until an equivalent equation of the form $x = a$, $a = a$, or $a = b$ results (where a and b are different numbers).
 - Solve linear equations with rational number coefficients, including equations whose solutions require expanding expressions using the distributive property and collecting like terms.

Solve real-world and mathematical problems involving volume of cylinders, cones, and spheres.

- 8.G.C.9** Know the formulas for the volumes of cones, cylinders, and spheres and use them to solve real-world and mathematical problems.

9. Find the area of the circle shown below.

$$\begin{aligned}A &= (8 \text{ mm})^2\pi \\&= 64\pi \text{ mm}^2\end{aligned}$$

10. Find the volume of the sphere shown below.

$$\begin{aligned}V &= \left(\frac{4}{3}\right)\pi(64 \text{ mm}^2)(8 \text{ mm}) \\&= \frac{2048}{3}\pi \text{ mm}^3\end{aligned}$$

Area and Volume II

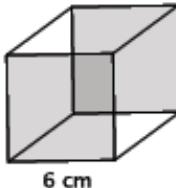

1. Find the area of the square shown below.

$$\begin{aligned} A &= (6 \text{ cm})^2 \\ &= 36 \text{ cm}^2 \end{aligned}$$

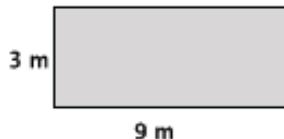

2. Find the volume of the cube shown below.

$$\begin{aligned} V &= (6 \text{ cm})^3 \\ &= 216 \text{ cm}^3 \end{aligned}$$

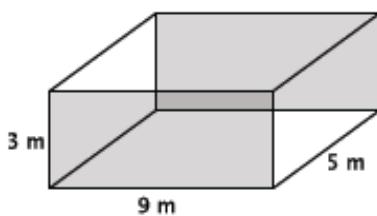

3. Find the area of the rectangle shown below.

$$\begin{aligned} A &= (9 \text{ m})(3 \text{ m}) \\ &= 27 \text{ m}^2 \end{aligned}$$

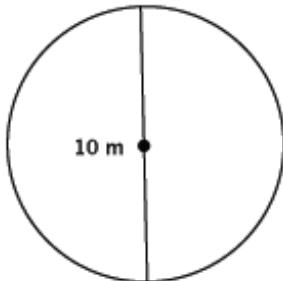

4. Find the volume of the rectangular prism shown below.

$$\begin{aligned} V &= (27 \text{ m}^2)(5 \text{ m}) \\ &= 135 \text{ m}^3 \end{aligned}$$

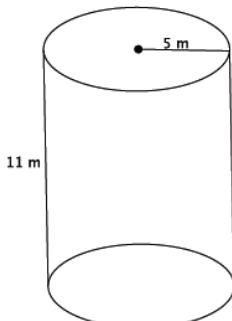

5. Find the area of the circle shown below.

$$\begin{aligned} A &= (5 \text{ m})^2\pi \\ &= 25\pi \text{ m}^2 \end{aligned}$$

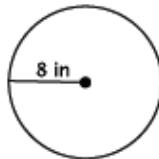

6. Find the volume of the cylinder shown below.

$$\begin{aligned}V &= (25\pi m^2)(11 m) \\&= 275\pi m^3\end{aligned}$$

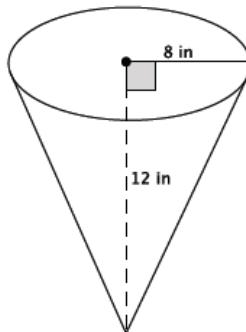

7. Find the area of the circle shown below.

$$\begin{aligned}A &= (8 \text{ in.})^2\pi \\&= 64\pi \text{ in}^2\end{aligned}$$

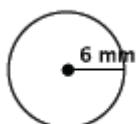

8. Find the volume of the cone shown below.

$$\begin{aligned}V &= \left(\frac{1}{3}\right)(64\pi \text{ in}^2)(12 \text{ in.}) \\&= 256\pi \text{ in}^3\end{aligned}$$

9. Find the area of the circle shown below.

$$\begin{aligned}A &= (6 \text{ mm})^2\pi \\&= 36\pi \text{ mm}^2\end{aligned}$$

10. Find the volume of the sphere shown below.

$$\begin{aligned}V &= \left(\frac{4}{3}\right)\pi(6 \text{ mm})^3 \\&= \frac{864}{3}\pi \text{ mm}^3 \\&= 288\pi \text{ mm}^3\end{aligned}$$
