

Lesson 17: The Area of a Circle

Student Outcomes

- Students give an informal derivation of the relationship between the circumference and area of a circle.
- Students know the formula for the area of a circle and use it to solve problems.

Lesson Notes

- Remind students of the definitions for circle and circumference from the previous lesson. The Opening Exercise is a lead-in to the derivation of the formula for the area of a circle.
- Not only do students need to know and be able to apply the formula for the area of a circle, it is critical for them to also be able to draw the diagram associated with each problem in order to solve it successfully.
- Students must be able to translate words into mathematical expressions and equations and be able to determine which parts of the problem are known and which are unknown or missing.

Classwork

Exercises 1–3 (4 minutes)

Lesson 17: The Area of a Circle 10/30/14

Date:

7•3

Find the length of a rectangle if the area is 27 cm^2 and the width is 3 cm. 3.

If the area of the rectangle is Area = length \cdot width, then 27 cm² = $1 \cdot 3$ cm.

$$\frac{1}{3} \cdot 27 \text{ cm}^2 = \frac{1}{3} \cdot 1 \cdot 3 \text{ cm}$$
$$9 \text{ cm} = 1$$

Lesson 17: The Area of a Circle 10/30/14

Date:

Example 2 (4 minutes)

Example 3 (4 minutes)

Make a point of telling students that an answer in exact form is in terms of π , not substituting an approximation of pi.

Example 3 Suzanne is making a circular table out of a square piece of wood. The radius of the circle that she is cutting is 3 feet. How much waste will she have for this project? Express your answer to the nearest square foot. Draw a diagram to assist you in solving the problem. What does the distance of 3 feet represent in this problem? The radius of the circle is 3 feet. r = 3 ftWhat information is needed to solve the problem? The area of the circle and the area of the square are needed so that we can subtract the area of the square from the area of the circle to determine the amount of waste. What information do we need to determine the area of the square and the circle? Circle: just radius because $A = \pi r^2$. Square: one side length.

Lesson 17: The Area of a Circle 10/30/14

engage^{ny}

252

How will we determine the waste?

The waste will be the area left over from the square after cutting out the circular region. The area of the circle is $A = \pi \cdot (3 \text{ ft.})^2 = 9\pi \text{ ft}^2 \approx 28.26 \text{ ft}^2$. The area of the square is found by first finding the diameter of the circle, which is the same as the side of the square. The diameter is d = 2r; so, $d = 2 \cdot 3$ ft. or 6 ft. The area of a square is found by multiplying the length and width; so, $A = 6 \text{ ft.} \cdot 6 \text{ ft.} = 36 \text{ ft}^2$. The solution will be the difference between the area of the square and the area of the circle; so, $36 \text{ ft}^2 - 28.26 \text{ ft}^2 \approx 7.74 \text{ ft}^2$.

Does your solution answer the problem as stated?

Yes, the amount of waste is 7.74 ft^2 .

Exercises 4–6 (11 minutes)

Solve in cooperative groups of two or three.

Lesson 17: The Ard Date: 10/30/

The Area of a Circle 10/30/14

Closing (3 minutes)

- Strategies for problem solving include drawing a diagram to represent the problem and identifying the given information and needed information to solve the problem.
- Using the original circle in this lesson, cut it into 64 equal slices. Reassemble the figure. What do you notice?
 - It looks more like a rectangle.

Ask students to imagine repeating the slicing into even thinner slices (infinitely thin). Then, ask the next two questions.

- What does the length of the rectangle become?
 - An approximation of half of the circumference of the circle.
- What does the width of the rectangle become?
 - An approximation of the radius.
- Thus, we conclude that the area of the circle is $A = \frac{1}{2}Cr$.
 - If $A = \frac{1}{2}Cr$, then $A = \frac{1}{2} \cdot 2\pi r \cdot r$ or $A = \pi r^2$. •

Relevant Vocabulary

CIRCULAR REGION (OR DISK): Given a point C in the plane and a number r > 0, the circular region (or disk) with center C and radius r is the set of all points in the plane whose distance from the point C is less than or equal to r.

The boundary of a disk is a circle. The "area of a circle" refers to the area of the disk defined by the circle.

A rectangle that has a perimeter of 132 ft. can have a length of 65.995 ft. and a width of 0.005 ft. The area of such a rectangle is 0.329975 ft², which is less than 1 ft². No, because a circle that has a circumference of 132 ft. will have a radius of approximately 21 ft.

 $A = \pi r^2 = \pi (21)^2 = 1387.96 \neq 1$

10. If the diameter of a circle is double the diameter of a second circle, what is the ratio of the area of the first circle to the area of the second?

If I choose a diameter of 24 cm for the first circle, then the diameter of the second circle is 12 cm. The first circle has a radius of 12 cm and an area of 144π cm². The second circle has a radius of 6 cm and an area of 36π cm². The ratio of the area of the first circle to the second is 144π cm² to 36π cm², which is a 4 to 1 ratio. The ratio of the diameters is 2, while the ratio of the areas is the square of 2, or 4.
